The invention relates to AgrD derived peptides, a composition containing a peptide and a carrier and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.

The present invention also describes a method for treating Staphylococcus aureus infection comprising the administration of a composition comprising (I). (I) has antibacterial activity, and can be used as an agr gene response inhibitor. The peptides are useful for treating S. aureus infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ьe
```

The present sequence is that of a novel synthetic cyclic peptide of the invention that is capable of inhibiting the agr response of Staphylococcus aureus. It is an AgrD-autoinducing peptide, where AgrD is a secreted agr-encoded peptide and where the agr locus controls the synthesis of printlence factor and other extracellular proteins responsible for printlence factor and other extracellular peptides may have the sequence NH2-X(n)-Z-X(y)-COOH, with a cyclic bond between the Z residue and COOH other than a thioester

Elimination of the thiol ester component of the cyclic ring structure can destroy agr response activating activity while preserving and enhancing inhibitory activity. A claimed method of preparing a cyclic peptide involves; assembling a linear paptide chain on to a solid phase resin support; deprotecting the resulting protected assembled peptide, treating the deprotected with neutral buffer for a time sufficient to form the cyclic peptide and cleave the peptide from the support, and recovering the cyclic peptide. The peptide is useful for
         This sequence represents the Staphylococcus aureus AgrDII derived peptide. The invention relates to AgrD derived cyclic peptides, a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                       Muir

                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the Staphylococcus aureus AgrDII derived peptide. The invention relates to AgrD derived cyclic peptides, a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Staphylococcus aureus infection; AgrD; agr response; treatment; virulence factor.

The present sequence is that of a protected peptide used in an example of the preparation of novel synthetic cyclic peptides of the invention (see hAM50899-906). The peptide corresponds to the Staphylococcus aureus AgrDII sequence with a Cys5 to Ser mutation (lactone). It was synthesised on a Wang-resin using an Fmoc N-alpha protection strategy. Following chain assembly, the peptide was cleaved from the support and the Ser-5 residue deprotected by treatment with a trifluoroacetic acid:anisole:water mixture (90:5:5) for 4 hr. The partially protected peptide-alpha carboxylates were then dissolved in DMF and treated with PyBOP and a catalytic amount of dimethylaminopyridine. Cyclization was complete after 2 hr. The remaining protecting groups were then removed by treatment with HF and the peptide purified by HPIC. The cyclic peptide is capable of inhibiting the agr response of Staphylococcus aureus. The thiololactone structure within native AgrD peptides is required for activation of this response. Replacement of the thiol ester component of the cyclic ring can destroy agr response activating activity while preserving and enhancing inhibitory activity. The cyclic peptides are useful for infection in the preserving and the securial interference, especially for the treatment of S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure;

                                                                                   The present sequence is that of a novel synthetic AgrD2 linear thioester peptide. The peptide is derived from the cyclic AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. The biological activity of the synthetic peptide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agr 3 prometer. This allowed activation or inhibition of the agr 2 response to be monitored spectrophocometrically. Unlike an AgrD2 thiololactone cyclic peptide (see AMM51001), the present peptide was unable to either activate or inhibit the agr response, even when added to cultured cells at uM concentrations. The invention when added to cultured cells at uM concentrations. The invention and methods for preparing them. The cyclic peptides are useful for infection interference, especially for the treatment of S. aureus

                                                                                                                                                   The present sequence is that of a novel synthetic AgrD2 linear free acid peptide. The peptide is derived from the cyclic AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. The biological activity of the synthesic spetide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agrB3 containing a beta-lactamase reporter gene fused to the agrB3 crontaining a beta-lactamase reporter densities of the agrB3 crontaining a beta-lactamase reporter gene fused to the agrB3 crosponse to be monitored spectrophotometrically. Unlike an AgrD2 thiololactone cyclic peptide (see AAMS1001), the present peptide was unable to either activate or inhibit the agr response, even when added to cultured cells at uM concentrations. The invention provides claimed cyclic peptides (see AAMS1099)906 and AAM50999)

Cand methods for preparing them. The cyclic peptides are useful for bacterial interference, especially for the treatment of S. aureus

                                                                                                                  The present sequence is that of a novel synthetic AgrD2 lactone cyclic peptide in which residue 5 of the peptide is linked to residue 9 via a lactone bond. The peptide is derived from an AgrD2 peptide of Staphylococcus aureus group II. AgrD2 is a secreted agr-encoded peptide, where the agr locus controls the synthesis of virulence factor and other extracellular proteins cresponsible for pathogenicity in S. aureus. The biological cativity of the synthetic peptide was assayed using cultured S. aureus strains containing a beta-lactamase reporter gene fused to the agrP3 promoter. This allowed activation or inhibition of the agr response to be monitored spectrophotometrically. The lactone AgrD2 peptide inhibited the agr response of group I. I or III strains. The invention provides claimed cyclic peptides (see AMS0899-906 and AAMS0999) and methods for preparing them, especially peptides where the cyclic bond is a lactam or lactone bond. The cyclic peptides are useful for bacterial interference, cespecially for the treatment of S. aureus infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising inhibitors of the quorum-sensing pathway of a microorganism are also provided. Methods using such AI-2 analogues are useful for treating pathogen-associated disease states. The compounds and antibiotic compositions can be used to inhibit bacterial cell growth and/or biofilm formation on a medical device, particularly for promoting growth of skin graft replacements used in the treatment of burns and ulcers. They may also be used to aid wound repair, and to inhibit bacterial cell growth and biofilm formation in or on products or devices used for personal hygiene. The present sequence represents a inhibitor of peptide-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of autoinducer-2 agonists or antagonists autoinducer-2 receptor, regulating bacterial also antibiotic compositions
                                                        S. aureus peptide #1 used for bacterial interference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the use of autoinducer-2 (AI-2) agonists or antagonists for regulating activity of autoinducer-2 receptor, regulating bacterial growth and pathogenesis. Symergistic antiblotic compositions

The invention relates to AgrD derived peptides, a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                   Misc-difference

The invention relates to AgrD derived cyclic peptides; a composition containing a peptide and a carrier, and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Muir

The present invention also describes a method for treating Staphylococcus aureus infection comprising the administration of a composition comprising (I). (I) has antibacterial activity, and can be used as an agr gene response inhibitor. The peptides are useful for treating S. aureus infections.

```

The present sequence is that of a novel synthetic cyclic peptide of the invention that is capable of inhibiting the agr response of staphylococcus aureus. It is an AgrD-autoinducing peptide, where

O.

AgrD is a secreted agr-encoded peptide and where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. Preferred peptides may have the sequence NH2-X(n)-Z-X(y)-COOH, with a

cyclic bond between the Z residue and COOH other than a thioester cond, where X is an amino acid, an amino acid analogue, a peptidomimetic or non-amide isostere, Z is a synthetic or a peptidomimetic or non-amide isostere, Z is a synthetic or a condition of the cyclic bond is 0-10 and y is 1-10. The cyclic bond is especially a lactam or lactone bond. The thiololactone structure within native AgrD peptides is required for activation of the agr response. Elimination of the thiol ester component of the cyclic ring structure can destroy agr response activating activity while preserving and enhancing inhibitory activity. A claimed method of preparing a cyclic peptide involves: assembling a linear peptide chain on to a solid phase resin support; deprotected peptide with neutral buffer for a time sufficient to form the cyclic peptide and cleave the peptide from the support; and recovering the cyclic peptide. The peptide is useful for and recovering interference, especially for the treatment of S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Staphylococcus aureus AgrDII sequence with a Cys5 to diaminopropionic card (Upr) mutation (lactam). It was synthesised on a Wang-resin cu using an Fmoc N-alpha protection strategy. Following chain assembly, the peptide was cleaved from the support and the Dpr-5 residue deprotected by treatment with a trifluoroacetic acid.anisole:water mixture (90:5:5) for 4 hr. The partially protected peptide-alpha carboxylates were then dissolved in DMF and treated with PyBOP. Cyclization was complete after 2 hr. The remaining protecting groups were removed by treatment with HF and the peptide purified by HPIC. The cyclic peptide is capable of inhibiting the agr response of staphylococcus aureus. The thiololactone structure within native AgrD peptides is required for activation of this response. Replacement of the thiol ester component of the cyclic ring structure with a lactam (as in the present case) or a lactone can destroy agr response activity. The cyclic peptides are useful for enhancing inhibitory activity. The cyclic peptides are useful for bacterial interference, especially for the treatment of S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a protected peptide used in an example of the preparation of novel synthetic cyclic peptides of the invention (see AAMS0899-906). The peptide corresponds to the

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of hits satisfying chosen parameters:

FUNCTION: COMPONENT OF THE CONT. THAT COVERS ER-DERIVED FUNCTION: COMPONENT OF THE STOLES IN TRANSPORT FROM THE ENDOPLASMIC RETICULUM TO THE GOLGI APPARATUS. COPII ACTS IN THE CYTOPLASM TO PROMOTE THE TRANSPORT OF SECRETORY, PLASMA MEMBRANE, AND VACUOLAR PROTEINS FROM THE ENDOPLASMIC RETICULUM TO THE GOLGI COMPLEX.

SUBUNIT: COPII IS COMPOSED OF AT LEAST FIVE PROTEINS: THE SEC23/24 COMPLEX, THE SEC13/31 COMPLEX AND SAIL (By Similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By Similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By Similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              387:84-87(1997).

PATHWAY: Proline biosynthesis; first step.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: Belongs to the glutamate 5-kinsee family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           STRTR

-!- CATALYTIC ACTIVITY: ATP + glycerol = ADP + glycerol 3-phosphate.
-!- PATHWAY: Glycerol utilization; rate-limiting step.
-!- SIMILARITY: BELONGS TO THE FUCOKINASE / GLUCONOKINASE / GLYCEROKINASE / XYLULOKINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GLPK OR AQ_434.
